

I am very concerned about interference that broadband over power lines could cause. During a recent community wide power failure I could receive more stations on my battery powered am/fm radio than I can with power on; broadband over power would likely make this much worse.

If the power company wants to build a separate signaling infrastructure along their right of way then I am all for it, but don't build new interference sources.

I personally would benefit from high speed access - there is no DSL or cable modem service available at my location. However, I don't want to destroy existing radio spectrum with new technologies that may never reach my suburban/rural location.
